

Portfolio Part 5 Instructions

STAT 244SC

Set Up

1. In a separate tab, open up Github and log into your account associated with your MHC email address.
2. Navigate to your `test_website` directory (folder) in rstudio.mtholyoke.edu. At this point, your `test_website` directory should just have:
 - `.gitignore`
 - `README.md`
 - `test_website.Rproj`
3. Make sure you can see the `Git` tab (usually on the top right by `History` and `Environment`). If you can't, double-click on your `test_website.Rproj` file in the `Files` explorer (usually the panel on the bottom right).

Create the Quarto Website

1. Click `File -> New Project -> New Directory -> Quarto Website` and make sure this is saved under your `test_website` directory.
2. Choose the name of your new Quarto website directory.
 - (a) If your website will be hosted at `https://username.github.io` (this is the default),
 - save the `Directory name` as `username.github.io`; for example, since my website will be at <https://lauralyman.github.io>, I will save my directory name as `lauralyman.github.io`
 - (b) If your website will be hosted at `https://username.github.io/some_name` (this is probably *not* the case),
 - save the `Directory name` as `some_name`

3. Select **Knitr** as the associated engine. Make sure nothing is selected except (optionally) **Use visual markdown editor**

We now have all the ingredients for a default Quarto website.

When you initialize a Quarto website, RStudio will automatically produce:

- `_quarto.yml`
- `about.qmd`
- `index.qmd`
- `style.css`
- an Rproj file (in my case, `lauralyman.github.io.Rproj`)

Exploring Your Website

(1) `_quarto.yml`

The `_quarto.yml` file includes: * the title of your website; * pages on the website: * the main landing page is `index.qmd`; * `about.qmd` is an optional additional page (that is, where you might write about yourself on a website); * a format section under `format` (includes, for example, the color scheme of the website)

(2) `index.qmd`

The `index.qmd` file controls default homepage for your website. To see ways to customize this website, check out this guide: <https://quarto.org/docs/reference/projects/websites.html>

(3) `styles.css`

The `styles.css` file is where you can place custom styles in your website (optional)

To render initial version of your website, navigate to `index.qmd` and hit **Render.**

Exercise

1. The `title` field in `index.qmd` is the header text at the top of your landing page (home page). Change it to something else. For example, I will change it to say “Welcome to my website!”. Click **Render** to see if your change worked!
2. Under `_quarto.yml`, change the `title` field to different text. For example, I will change mine to say “Laura Lyman’s Website”. Go back to `index.qmd` to hit **Render** to see your changes.

Changing Output Directory of Quarto Website

This step is *critical* if you want to host your website on Github using Github pages (which you do!)

The output directory is the folder is where Quarto saves the files to render your website. To use Github pages, we need this output directory to be named `docs`.

1. Go to `_quarto.yml`
2. Add the line `output-dir: docs` under `type: website`. For example, my code looks like this:

```
project:
  type: website
  output-dir: docs
```

3. Hit save
4. Navigate back to `index.qmd`. You should be able to see the `docs` folder appear.
5. The default folder for website files is `_site`, but now after saving/rendering, we (correctly) have the `docs` folder instead. Go ahead and **delete** the `_site` folder.

Moving Files to Correct Locations

We actually need all of the generated website code in `username.github.io` to be in your outer directory (the one that is directly linked to Github). I know this step will feel awkward, and I'm sure there's likely a better way to do this, but for now, let's do the following.

1. Navigate to your `username.github.io` directory and check *every file inside of it*.
2. Click on the gear icon and then select **Move**. Move all of the files up one directory (to `test_website`).
3. Now navigate to `test_website`. You can actually **delete** the `testwebsite.Rproj` file (but be sure to keep the `Rproj` file with your Github username!)

Commit Changes to Github

Let's try committing what we have to Github.

1. Click on **Commit** under the **Git** pane (usually on the top right of RStudio).
2. Select all files *except* the `.gitignore`
3. Add a commit message.
4. Click **Commit**.
5. Click **Push**.
6. Navigate to your Github account. If successful, you should see your new files added there.

Configure Website on Github

1. On your Github account, click **Settings** (gear icon on the top of the website).
2. On the left navigation panel, find and click on **Pages**.
3. Under **Branch**, select **main**. **Change the root folder to docs.**
4. Click **Save**.
5. Refresh the page. You should eventually see something like this:

GitHub Pages

[GitHub Pages](#) is designed to host your personal, organization, or project pages from a GitHub repository.

Your site is live at <https://lauralyman.github.io/>

Last [deployed](#) by  [lauralyman](#) 1 hour ago

[Visit site](#) [...](#)

It may take up to 10 minutes to see the above, since it takes time for your website to first deploy.

6. Once Github indicates that your website is deployed, click “Visit site” to go look at it. Your website is now on the internet!
